<tr><td colspan="3">... make the connection between weighing stations and database</td></tr>
<tr><td colspan="3">... using a PHP script.</td></tr>
<tr><td>Requirements according to the work order</td><td colspan="3">• Must
○ Implement a script in PHP that will receive data from the controller and send back adequate replies.
○ You should use POST (or GET) variables to read and interpret the following incoming information from a weighing station:
○ CASE 1: Authentication: the user’s identification code.
○ CASE 2: Weighing:
▪ Hostname (of the waste balance)
▪ Weight being registered.
▪ User’s QR code
• Should
○ Implement a second script in PHP that will be used to troubleshoot eventual problems. For this, create a PHP form that will post data to the PHP form created above. *
• Could
○</td></tr>
<tr><td colspan="4">Tasks according to the work order</td></tr>
<tr><td colspan="4">* To support testing and development, a new PHP form should be available to developers that allows them to enter the hostname of the waste balance, the weight being registered, and the user's QR code. This form will enable developers to test their website by simulating the weighing stations that will later send the same data to the website.</td></tr>
